

## H02H

**EMERGENCY PROTECTIVE CIRCUIT ARRANGEMENTS** (indicating or signalling undesired working conditions [G01R](#), e.g. [G01R 31/00](#), [G08B](#); locating faults along lines [G01R 31/08](#); emergency protective devices [H01H](#))

### Definition statement

*This place covers:*

Emergency electric circuit arrangements for the automatic protection of electric equipment used for generation, conversion, transmission or distribution of electric power in the event of an abnormal operating condition.

Thus the scope of this subclass is limited to protective circuits for the protection of power systems for: generating electric power (alternators, generators), converting electric power (power convertors in HVDC links, power motors for industrial applications, power transformers), transmission of electric power (High Voltage AC or HVDC lines or cables) or distribution of electric power (Medium voltage lines, cables and distribution switchgear and Low Voltage lines, cables and switchgear up to the sockets of secondary customers)

In this subclass, the protective circuit arrangements are classified :

A. according to the measures taken:

- Automatic disconnection by means of any type of switch (circuit-breaker, disconnector, interrupter, fuse or static switches) directly responsive to an undesired change from normal electric or non-electric operating conditions with or without subsequent reconnection.
- Limiting excess current or voltage without disconnection.
- Preventing the switching-on in case an undesired working condition might result.

B. or/and by the device being protected, e.g. transformer, motor...

C. or/and by the model used to simulate the device

D. by details of one of the above, e.g. detection means

### Special rules of classification

Subgroups and head group:

If the subject-matter of a document relates to a protective circuit having different functionalities for each of which a sub-group exists, then the document is to be classified in the head-group unless a sub-group exists for this particular combination of functionalities (e.g. [H02H 3/10](#), [H02H 3/207](#)).

## H02H 1/00

### Details of emergency protective circuit arrangements

#### Definition statement

*This place covers:*

All details of emergency protective circuit arrangements covering the detection means, the connection of the detection means, the transmission of signals, the data processing means, the arrangements for preventing response to transient abnormal conditions and the arrangements for supplying operative power to the circuit arrangements (e.g monitoring of power supply for trip energy, backup supply, avoid failure due to high voltage testing).

#### References

##### Informative references

*Attention is drawn to the following places, which may be of interest for search:*

Detection means per se	<a href="#">G01</a> , e.g. <a href="#">G01R</a>
Means for detecting the presence of an arc structurally associated with emergency protective devices: for switches in general for HV circuit breakers	<a href="#">H01H 9/50</a> , <a href="#">H01H 33/26</a>
Means for detecting or reacting to mechanical or electrical defects (structurally associated with Gas-insulated switchgear)	<a href="#">H02B 13/065</a>

#### Special rules of classification

As this group concerns details of emergency protective circuits, it is normally combined with a group symbol or an Indexing Code the aspect it is a detail of. Example: WO 2009123615 (Hewlett Packard Development company) is classified in [H02H 1/0007](#) and in [H02H 3/087](#). In exceptional cases is inventive information classified here only.

## H02H 1/06

### Arrangements for supplying operative power {(power supply arrangements in general [G05F](#), [H02M](#))}

#### References

##### Informative references

*Attention is drawn to the following places, which may be of interest for search:*

Power supply arrangements in general	<a href="#">G05F</a> , <a href="#">H02M</a>
--------------------------------------	---

## H02H 3/00

**Emergency protective circuit arrangements for automatic disconnection directly responsive to an undesired change from normal electric working condition with or without subsequent reconnection (specially adapted for specific types of electric machines or apparatus or for sectionalised protection of cable of line systems [H02H 7/00](#); systems for change-over to standby supply [H02J 9/00](#) ){integrated protection (for motors [H02H 7/0822](#))}**

### Definition statement

*This place covers:*

This group is subdivided according to the electric parameter it is responsive to (e.g. overcurrent, overvoltage) and comprises all kinds of protective circuits comprising detection means for the detection of electrical variables of the power equipment to be protected (e.g. current transformers or sensors, voltage transformers or sensors), analog or digital circuits for converting, analysing or comparing the detected electrical values with pre-determined threshold levels and initiating a tripping signal to a disconnecting device to automatically disconnect the equipment to be protected from the power source to avoid or to limit damages to the equipment. These circuits may also be provided with reclosing features.

.Various types of protection are covered: overcurrent, overvoltage, undervoltage, earth fault, differential protection, distance protection, phase loss, unbalance...

### References

#### Limiting references

Specially adapted for specific types of electric machines or apparatus or for sectionalised protection of cable or line systems	<a href="#">H02H 7/00</a>
Load shedding, e.g. maintaining supply	<a href="#">H02J 1/14</a> or <a href="#">H02J 3/14</a>
Systems for change-over to standby supply	<a href="#">H02J 9/00</a>

#### Informative references

*Attention is drawn to the following places, which may be of interest for search:*

Testing of protective devices, e.g. with a separate device	<a href="#">G01R 31/2827</a>
Protective switch with testing means	<a href="#">H01H 83/04</a>

### Special rules of classification

- Protective circuits protecting against the effects of geomagnetic induced current (GIC) are classified in the head group [H02H 3/00](#)
- Protective circuits responsive to more than two electric variables or to electric variables not covered by the subgroups are classified in [H02H 3/00](#).

## H02H 3/027

with automatic disconnection after a predetermined time ([H02H 3/033](#), [H02H 3/06](#) take precedence; {timing in overcurrent protection circuits [H02H 3/093](#); in undervoltage protection circuits [H02H 3/247](#); staggered disconnection [H02H 7/30](#)})

### References

#### Limiting references

*This place does not cover:*

Several disconnections in a preferential order	<a href="#">H02H 3/033</a>
Automatic reconnection	<a href="#">H02H 3/06</a>

**Emergency protective circuit arrangements responsive to undesired changes from normal non-electric working conditions using simulators of the apparatus being protected, e.g. using thermal images**

**Definition statement**

*This place covers:*

Protective circuits comprising simulation or modelling means for the determination of non-electrical variables of the power equipment to be protected (e.g. temperature), and comparing the simulated non-electric variables with pre-determined threshold levels and initiating a tripping signal to a disconnecting device to automatically disconnect the equipment to be protected from the power source to avoid or to limit damages to the equipment or to protect living beings. These circuits may also be provided with reclosing features.

**H02H 7/00**

**Emergency protective circuit arrangements specially adapted for specific types of electric machines or apparatus or for sectionalised protection of cable or line systems, and effecting automatic switching in the event of an undesired change from normal working conditions (structural association of protective devices with specific machines or apparatus and their protection without automatic disconnection, see the relevant subclass for the machine or apparatus)**

**Definition statement**

*This place covers:*

Emergency protective circuit arrangements specially adapted for protecting specific types of electric machines or apparatus (e.g. transformers, electric motors) and effecting automatic switching in the event of an undesired change from normal electric or non-electric working conditions.

This group covers also emergency protective circuit arrangements for sectionalised protection of cable or line systems, e.g. for disconnecting a section on which short-circuit, earth fault, or arc discharge has occurred. The objectives of these type of protective circuits is to keep the power system stable and/or to minimize an outage to the greatest extend possible when abnormal electrical conditions occur (e.g. through protective device coordination).

## H02H 11/00

**Emergency protective circuit arrangements for preventing the switching-on in case an undesired electric working condition might result**

### Definition statement

*This place covers:*

e.g. in case of incorrect or interrupted earth connection, in case of inverted polarity or connection, in case of incorrect phase sequence, in case of too high or too low isolation resistance, too high load, short-circuit or earth fault, in case of too high or too low voltage, or preventing unsafe switching conditions.

### Special rules of classification

Protective circuits for preventing connection of outlets to power source if no load and detection of human body should be classified in [H02H 5/12](#) and an Indexing Code given in [H01H 11/00](#).
